The specification of the document object model (DOM) defines the document hierarchy, the formatting information and the relationships between drawing objects. The document hierarchy is built using an object database that is separate from the drawing and is stored in a file called.DWG in the program's data directory. It defines the role of all objects. All objects belong to one or more entities. Each entity is either a drawing or a layer. The layers are arranged in a tree that resembles the document hierarchy. All entities and entities that are children of the current entity form a tree. The data in the file stores a complete version history of the current document. The drawing can be viewed as a tree of entities and each entity can have properties, which form the document state. In addition, the object database has records for the text, the dimensions, the annotations, the plots, and the references. For the operations of the drawing, several systems are provided. Each one of them solves a specific problem. The drawing system stores the status and control of the objects in the drawing. Objects can have properties and this information is stored in the object database. The operating system loads each object into the memory and then the properties are read from the object database and loaded into the memory. Each object can also have a drawing order. In this case, objects are processed in a strict order and for each object, all objects in the previous level must be in the order specified by the user. The operation of the drawing system is managed by the operating system, which controls

access to the data. The Document Browser is a tool that provides a graphical user interface for managing the drawing and the objects in it. It manages the drawing by separating it into different views and can also be used as a drawing manager for the objects. It can also be used as a general tool for other applications. To edit objects in the drawing, a specific system is used. The object editor can be used to move, rotate, zoom and scale the objects in the drawing. The objects can also be grouped to manage the hierarchy of the objects. The layout tool is used to arrange the objects in the drawing. The layout tools include the AutoLISP layout system, the Visual LISP layout system and the .NET layout system. When the application needs to convert to a different format, a conversion system is used. The .NET format is supported by the Windows .NET platform. The control system manages the drawing and the ca3bfb1094
